

WORLD STATS TEST TASK

Example “World” database has the following structure:

Your task is to render summary table containing the following info for each region:

- Continent name;
- Region name;
- Number of countries;
- Average life duration (expectancy) in years;
- Total population;
- Number of cities (**advanced, is a plus**);
- Number of regional languages (**advanced, is a plus**);

Table should be rendered using HTML/CSS/JavaScript and contain emphasized header row and multiple data rows. User should be able to sort table by any column (ascending / descending) by clicking on corresponding column header. Table sorting must be performed on both **client-side** and **server-side** (there must be a switch on the page which controls where sorting is performed). Server-side sorting should be performed without page reload (using ajax).

Technologies to use:

1. **PHP** to dump data from database and push it to the client;
2. **JavaScript/HTML** for client-side table rendering;
3. **CSS** for applying visual style to the table;
4. **JavaScript/AJAX/DOM** for on-page sorting and table reconfiguration;
5. You should produce **cross-browser** code (working at least in Chrome / FireFox);

Result table could be looking like the one below:

World database test

Continent	Region	Countries	LifeDuration	Population	Cities	Languages
Asia	Eastern Asia	8	75.25	1507328000	740	43
